THEORY OF HYBRID FILTERS FOR SIMULTANEOUS  
OPERATION OF A TRANSMITTER AND RECEIVER WITH COMMON  
ANTENNA CIRCUITS AND COMMON  
POWER SUPPLY (POLSKA) in Polish

An analysis is given of suitable networks using either concentrated N, L or C elements or transmission-line sections. Formulae for the attenuation by the receiver input of the transmitted signal together with those for the limiting effect on the input signal to the receiver of the circuit suppressing the signal transmitted are given. Design principles of the filters under consideration and some numerical examples are included. Poltek Technical Abstracts

AUTHORS: Czyż, Z., Master of Engineering, and Mościcki, T., Engineer

TITLE: Equipment for automatic measurement of antenna characteristics  
radiograph model PIT-2270-60

PERIODICAL: Przegląd Telekomunikacyjny, no. 1, 1961, 33-34

TEXT: The article describes the PIT-2270-60 radiograph produced by the Zakład Doświadczalny przy Przemysłowy Instytut Telekomunikacji (Experimental Department at the Institute of Telecommunication). The radiograph automatically registers the characteristics of microwave directional antennas. The measurement dynamic is limited to about 20 dB, when measurements are made without the aid of a radiograph. With the aid of the PIT-2270-60 radiograph, the measurement dynamic is 50-60 dB and time required for measurements is cut down to only a few minutes. The radiograph is a narrow-band received, directly amplified, and operates on 1,000 cps frequency. The 1,000 cps signal received from the radio frequency detector is fed into a pre-amplifier from which it is fed into the resistance arrangement of a regulating potentiometer. In order to decrease humming and other noises, the signal is fed into a narrow-band amplifier, which narrows the

Equipment for automatic measurement ...

band to  $f = 20$  cps. After further amplification the signal is rectified and applied to the steering grid of one of the two tubes of the DC amplifier, operating in opposite directions. The steering voltage of the second tube is fed from the anode of the first tube through a resistance separator. The voltage is selected in such a way that speed and direction of the recorder tip are constant regardless of the magnitude of signals and writing direction. The recorder tip is connected to both anodes of the end tubes and is located in the magnetic field created by two electromagnets. The servo-mechanical link transmits angular data from the tripod to the tape shifting box. Voltage fed from transmitting selsyns is shifted to control selsyns, turning them at the same time in the direction faced by the tripod. Simultaneously, the pressure through transformer selsyns is shifted to two (narrow and wide) channels of the servo-mechanism amplifier. The resulting pressure from the two channels is amplified and transmitted to the servo-motor. The motor activates the tape shifting box and the rotors of the transformer selsyns to the position taken up by the rotors of the transmitting selsyns. Technical data: a) band of microwave frequency = arbitrary; b) measurement dynamic when using detector with square characteristics = 30 dB. c) sensitivity = 50 v; d) decibel scale = 1 dB - 5 mm; e) accuracy of the decibel scale =  $\pm 0.15$  dB; f) angle scale =  $1^\circ - 2^\circ$ ; 5; 20 mm; g) registration

1. Of the Pediatric Clinic of Wroclaw University (Director -- Prof.  
Hanna Hirsfeldowa, M.D.).

CZYŻEWSKA J. Klinika Dziecięcej Uniw., Wrocław. Prowlekłe gruźlicze zapalenie opon mózgowych leczone streptomycina Chronic tuberculous meningitis treated with streptomycin Gruźlica, Warsaw 1949, 17/3-4 (274-293) Tables 3

Among the clinical signs the 'frog-position' is described, which the author observed especially in young children in a late stage of the disease; the children lie on their back with their lower limbs in strong flexion at the hips and knee joints. It is reminiscent of the position assumed by children with congenital dislocation of the hip. This sign was observed in serious cases. Of 102 patients 65 died, 9 recovered (they were followed up for more than a year); 28 remained still under observation.

CZYŻEWSKA, J.

1921. CZYZEWSKA J. 1. Klin. ped. Akad. med., Wrocław. \*Wyniki leczenia różnymi metodami gruźliczego zapalenia opon mózgowo-rdzeniowych u dzieci w latach 1948-1953. Results of different regimens of treatment in tuberculous meningitis in children during 1948-1953 GRUŻLICA 1954, 22/8 (539-546) Graphs 4 Tables 1
- 272 cases were treated between 1948 and 1953. Of these, 118 were cured. The percentages of cured cases differed from year to year; they are related to the age of the patients, their condition on admission to the hospital, and the regimen of treatment. The best results were obtained with the following regimen: INH both orally and intrathecally, and streptomycin i. m.; this regimen resulted in 67% recoveries, the duration of treatment being shorter, the clinical symptoms subsiding and CSF clearing promptly. Relapses, however, were observed more frequently than with other regimens of treatment. They were, however, mild, and they responded well to the repeated treatment. Various clinical symptoms were observed in the course of the disease, such as: disturbances of the hypothalamo-pituitary system, leapfrog position, etc. These symptoms were more frequently observed with previous methods of treatment. In the meningitis treated with INH orally and intrathecally, combined with streptomycin i. m., these symptoms appeared but rarely. Hydrocephalus developed as a relatively frequent complication in treated cases. It could be diagnosed on clinical symptoms, CSF findings and encephalography. In several cases encephalography performed for diagnostic purposes resulted in regression of clinical symptoms of hydrocephalus; this could be explained by the rupture of recent adhesions by air introduced into the craniovertebral canal. In cured cases, the examinations of mental development were carried out; they showed that in the first period after treatment, the mental development of the child corresponds to that previous to illness; in the later years, however, it reaches the level corresponding to the age of the child. "Vitamin C Level in the Blood and Urine of Children during the Course of Infectious Diseases."

Warsaw, Przegląd Epidemiologiczny, Vol 19, No 2, 1965; pp 175-176.

Abstract: Study of vitamin C levels in sera and urine of 85 healthy children and of 106 children with various infectious diseases, with a total of 608 determinations--at the beginning, during, and at the end of the disease (7-day intervals). There was a trend for vitamin C levels to fall progressively in the more severe cases, and to increase during the course of the disease in lighter cases; in severe cases there was also a frequently noted fall in hemoglobin. Specific data are given on trends in infectious hepatitis, tuberculosis, measles, pertussis, and diphtheria. Presented at the 3rd Scientific Assembly of Polish Epidemiologists and Infectologists, Krakow, 5-6 Oct 64.

2095. CZYŻEWSKI K., DOLATA W. and ROSOWSKI F. Kat. I Chir. A. M., Wrocław. Wskazania do hipotermii z blokadą vegetatywną *Indications for hypothermia with vegetative blockage* Pol. Przegl. chir. 1956, 28/8 (879—881) Tables 1

Hypothermia is indicated under the following conditions: Acute: initial shock, traumatic shock, ileus and peritonitis. Chronic: seriously damaged internal equilibrium of the body, operations suggesting a possibility of damaging this equilibrium, i.e. long-term operations, impairment of oxidation, excitation of the vegetative plexus and a possibility of massive haemorrhage.

2297. PHYSIOPATHOLOGICAL BASES OF SURGICAL TREATMENT OF LIVER CIRRHOSIS WITH THE LIGATION OF ARTERIES - Fizjopatologiczne podstawy chirurgicznego leczenia marskości wątroby podwiązaniem tętnic - Czyżewski K., Falkiewicz A. and Rosowski F. Klin. A.M., Wrocław - POL. ARCH. MED. WEWNĘT. 1957, 27/1 (1-14) Tables 3 illus. 6

The surgical methods of treatment of liver cirrhosis are surveyed. Five cases from the authors' own material are quoted. The ligation of hepatic arteries - with or without splenectomy - was performed with fatal outcome in all cases. In the authors' opinion it is nevertheless a promising operation and should be tried under new and improved circumstances.

"Hypotensive Duodenography in the Diagnosis of Subacute Pancreatitis"

Warsaw, Polski Tygodnik Lekarski, Vol XVIII, No 6, 4 Feb 1963, pp 207-210

Abstract: [Authors' English summary modified] Hypotensive duodenography was introduced into the diagnosis of pancreatic diseases by the Lyon School 3 years ago. The techniques used by the authors are described. Hypotonia of the duodenum was obtained by antronyl injection and introduction of 20 cc 0.5% solution of xylocaine into the duodenum. 54 hypotensive duodenographies were performed, 23 of them in diseases of the pancreas.

Warsaw-Krakow, Przegląd Lekarski, Vol 19, Ser II, No 3, [24 Mar] 63, pp 179-180.

Abstract: Authors give their criteria for rating results as good, uncertain, and poor and give statistical result of follow-up (up to 12 years) on 1164 cases treated by medication and 151 treated by operation. Although percentage of good results much higher in operation cases (94.7 to 73.7 percent), the frequency of complications (also summarized statistically) call for careful consideration of the mode of treatment. Of the 9 refs., 4 are Polish, 2 each Russian and German, and one is French.
